Upload checklist

iekcorbar — batch of 24 October 2026

The idea: while players are online you only *stage* the files (step 1). Nothing in a running server is touched. When the server is empty you stop it, swap everything in one go and start again. Everything below is **untested in-game**, so keep the old jars (step 5) for a quick rollback.

What is in this batch

Part	New version	What changed (short)
Steamworks	0.3.8	Zukan now finds the recipe of every Steamworks item (was: "dropped by mobs"). Stair/slab cover 1.02 (no vanilla texture showing through)
Kitchen	0.2.1	Kitchen decor (18 items), meals no longer z-fight
Wildlife	0.3.0	NEW: African elephant + plains zebra, baby versions of every animal (a golden dandelion keeps a baby small), breeding (feed an adult), spawn eggs, a statue of every animal (adult, rare, baby), animals on a lead stay, boar can ram again, harmless animals never attack. Plus the Zoo and spawn tuning
Sakagura	0.2.0	Garden decor (21 items)
Kura	0.1.4	Clean stop
Zukan	0.2.2	Steampunk GUI, /zukan givebook, trader book
Relics	0.3.0	Countdown board, bigger harp/stall/banner/hearth/grave, grave shows last death, Bone Xylophone, groups
IekcorbarSiteSync	1.14.2	Engineer's Manual book + trader swap
Iekcorbar-pack.zip	3.3 MB	ONE merged resource pack with all plugin packs, sounds, z-fight fixes and pack icon
WanderingTrades	3 files	zukan.yml, engineers_manual.yml, wildlife.yml
Website	new zip	Only when you ask me to build it (step 13)

Before you start: the staging folder

On your PC there is a ready-made folder **iekcorbar-final\upload-2026-10-24** that has the same layout as your server. Everything in it can be copied as-is. Its content:

```
plugins/*.jar (8 jars)
plugins/ResourcePackManager/mixer/Iekcorbar-pack.zip
plugins/WanderingTrades/trades/ (3 files)
plugins/FreeMinecraftModels/models/wildlife/ (76 animal models)
```

Part 1 — While players are online (safe)

- **1. Stage the files.** Upload the whole **upload-2026-10-24** folder to the server, but **outside** `plugins/` (for example next to it, as `/upload-2026-10-24/`). A jar copied into plugins/ over a running plugin can crash it, and a new zip in the mixer folder makes ResourcePackManager re-send the pack to everybody. So: not yet.
- **2. Announce the restart** in Discord and in the game (a time, 10-15 minutes of warning). The Discord post I wrote earlier can be reused.

Part 2 — When the server is empty

- **3. Stop the server cleanly** with `stop` (not a kill). Wait until it says it is closed. The plugins now skip the work that used to cause the "hasn't ticked" lag.
- **4. Make a backup.** Copy at least the world folders and `plugins/Steamworks`, `Kitchen`, `Relics`, `Wildlife`, `Sakagura`, `Kura`, `Zukan`, `IekcorbarSiteSync`. Placed machines, props and crops live in the world's chunk data, so the world matters most.
- **5. Move the old jars** out of plugins/ into a folder like `/old-jars-2026-10-24/` (do not delete: this is your rollback). There must be exactly **one jar per plugin** in plugins/.

Part 3 — Swap the files

6. Plugin jars — copy from the staging folder into `plugins/`:

Remove (old)	Put in (new)
Steamworks-*.jar	Steamworks-0.3.8.jar
Kitchen-*.jar	Kitchen-0.2.1.jar
Wildlife-*.jar	Wildlife-0.3.0.jar
Sakagura-*.jar	Sakagura-0.2.0.jar
Kura-*.jar	Kura-0.1.4.jar
Zukan-*.jar	Zukan-0.2.2.jar
Relics-*.jar	Relics-0.3.0.jar
IekcorbarSiteSync-*.jar	IekcorbarSiteSync-1.14.2.jar

7. Resource pack — in `plugins/ResourcePackManager/mixer/`:

- Remove the separate old packs if they are still there: Steamworks-blocks.zip, Kitchen-pack.zip, Sakagura-pack.zip, Relics-pack.zip, Kura-pack.zip, Wildlife-sounds.zip, Zukan-pack.zip, Zoo-pack.zip, Garden-pack.zip, Kitchendecor-pack.zip and any older Iekcorbar-pack.zip. (Other people's packs that are not ours stay.)
- Put in **Iekcorbar-pack.zip** (the new one, 3.3 MB). Having just this one file means players get one reload instead of many.

7b. Animal models — copy the folder `plugins/FreeMinecraftModels/models/wildlife/` from the staging folder into the same place on the server and **overwrite** (76 files: elephant, zebra and a baby version of every animal are new). Without them no animals spawn and the console warns about a model that FreeMinecraftModels does not know.

8. WanderingTrades — copy the three files into `plugins/WanderingTrades/trades/` (`zukan.yml`, `engineers_manual.yml`, `wildlife.yml`). Leave microblocks.yml as it is.

9. Config by hand. A new jar never overwrites the config on the server, so a few values must be copied yourself:

File	What to set
plugins/Wildlife/config.yml	under **spawning:** set `chance: 0.55`, `interval-seconds: 6`, `max-animals-near-player: 8` (the values you approved).
plugins/Relics/config.yml	Optional: copy the `new-year:` block (zones list) from the repo's Relics/src/main/resources/config.yml if you want to edit the countdown-board zones. Without it the built-in list of 10 zones is used.
plugins/Zukan/config.yml	Only if the browser looks plain after the start: add `gui-style: steampunk` and `swap-key: true`.
Steamworks machines.yml	Nothing: missing sections fall back to the built-in ones.

File	What to set
IekcorbarSiteSync books	Nothing: engineers_manual.txt is written to plugins/IekcorbarSiteSync/books/ on the first start.

Part 4 — Start and check

- **10. Start the server** and watch the console. Every plugin above should say it is enabled; look for red lines containing the plugin names. Save `logs/latest.log` of this start and send it to me if anything looks wrong (I also still need it for the pack-reload question).
- **11. Reload the books:** `/ibook reload`, then `/ibook list` should show *engineers_manual*.
- **12. Join and accept the new pack.** The pack icon (brass gear with a sakura) should show in the pack list.

In-game quick test (about 10 minutes)

Plugin	Try this
Relics	`/relics list` (groups, click one). Place: harp (right-click plays, sneak+right-click next tune), Christmas market stall, Torn Settlement Banner (floor and wall), Hearth, Settler's Grave (3 lines of text, die once and check the name), Countdown Board, Bone Xylophone. If a relic cannot be removed: `/relics remove 3`.
Zukan	`/zukan`: steampunk window aligned? Craft or `/zukan givebook`.
Wildlife	Walk around: animals appear but scarcely. `/wildlife spawn elephant`, `/wildlife spawn zebra baby`, `/wildlife egg deer` (right-click a block; sneak = baby). Feed two deer wheat: they walk to each other and a baby appears; a golden dandelion on the baby keeps it small. A lead on an animal. The boar rams. `/wildlife giveall` for the statues (place, hit to pick up). `/zoo help`, place a kiosk + turnstile.
Kitchen / Sakagura	Place decor (counter, chair; garden fence). Check seeds/fruit in the hand.
Steamworks	Stairs/slabs: no vanilla texture showing through. Machines still run.
Traders	`/ibook give <you> engineers_manual`. Wandering traders will sell the manual, Zukan and Field Journal.
Lag	Stop and start once more later: restart should now be quick (no Discord "hasn't ticked").

Part 5 — Website and wiki (separate from the server)

- **13. Website zip.** Say "maak de website zip" and I build a fresh one (I only do that on request). Upload and extract on Plesk, press **NPM install**, build/start as usual. Do not forget: db.json is never included on purpose.
- **14. Wiki pages.** Log in as staff and use the import buttons on /wiki: Steamworks (Refresh), Kitchen, Wildlife, Kura Storage, Zukan, Sakagura. There are no wiki pages yet for Zoo, Garden/Kitchen decor and Relics (Relics stays out of public docs until the paid-pack decision).
- **15. Brewing page.** Staff: click "Import Sakagura recipes" on /brewing if you have not yet.
- **16. Discord.** Post the staff update (use the two English messages from before; it does not mention the Relics paid pack).

Rollback

If something goes wrong: stop the server, remove the new jar(s) of the failing plugin, put the matching jar back from `/old-jars-2026-10-24/`, and for pack trouble put the old separate zips back in the mixer folder. The worlds and plugin data keep working with the old versions, because only code and models

changed.

Not part of this batch

EliteMobs custom models (parked on your request), the old IekcorbarSiteSync jars 1.5.0 to 1.8.1 and old Relics jars in the repo, and the earlier zips (iekcorbar_elite_models_test.zip etc.): do not upload those.

Tip: tick the boxes as you go. If a step fails, stop there and tell me which number and what the console says.
